

Title: GP Clinical Research Benefits and Outcomes

Author: Ed Bennett

Abstract:

It is well established that corneal GP lens use is not high - but nevertheless has many applications - while scleral lens use continues to increase. This presentation addresses relevant GP clinical research and the benefits of this research as performed by the presenter. This includes the following topics: optimizing initial GP comfort, should GP lenses be modified?, overnight corneal swelling with GP lenses, Acanthamoeba adherence, first-fit orthokeratology success rate, multifocals versus monovision, patient satisfaction with different presbyopic corrections, and scleral lens settling. Bottom line results and recommendations are provided.
