

**Title: Revisiting the Role of Ocular Dominance in Presbyopic Contact Lens Correction**

**Author: Thomas Quinn**

**Abstract:**

Ocular dominance is widely regarded as an important factor in success with multifocal and monovision contact lens correction. Various methods of determining eye dominance have been employed, many of which have demonstrated very little agreement.

This presentation will review our current understanding of eye dominance and its role in contact lens success for the presbyopic population. Further, a new approach to assessing eye dominance will be presented.
